

21CN Advice

21CN is BT's next generation telecoms and data network - an IP based, advanced communications network that will replace the existing PSTN telephone network over the next 5 years

The BSIA have recently indicated that as many as 40% of the UK digital communicators installed may not be able to migrate to the 21st Century Network. This could result in a digital communicator not functioning as expected in the event of a genuine alarm transmission.

Don't take chances, roll out your signalling with DualCom GPRS

CSL DualCom has developed a series of product innovations to help the UK Security Industry deal with the transition from the legacy network to the 21st Century Network :

DualCom GPRS G2

This Grade 2 product is specifically aimed at the non-secure signalling sector currently occupied by some 800,000 digital communicators. The product is designed and priced to replace digital communicators that may be incompatible with the new 21st Century Network.

21CN-MODE™

All DualCom products have a programmable 21CN mode whereby enhanced polling on the radio path will avoid unnecessary keyholder contact from telephone or IP path disruptions. 21CN-MODE™ can also be used to increase polling over Holiday or high-stock periods.

Priority Polling™

Every GPRS DualCom G3 that has been installed over the last two years will enjoy an enhanced 10 minute polling cycle – completely free of charge. www.csldual.com/pressreleases/CSL_Press_Release_17_10_07.pdf

Gemini Callback™

For additional peace of mind all DualCom products will incorporate the unique Callback feature. If the DualCom fails a GPRS polling call we will call the DualCom over the GSM path to verify that it can still make outgoing calls before keyholders get disturbed unnecessarily. www.csldual.com/callback
